

## **EXPENSE TRACKER — PROJECT SYNOPSIS**

### **1. Project Title**

#### **Expense Tracker**

### **2. Introduction**

Expense Tracker is a simple and user-friendly web application developed to help users record and manage their daily expenses. The application provides a single webpage where users can enter expense details, view their recorded expenses, and monitor their total spending.

The project is developed using frontend technologies such as HTML, CSS, and JavaScript. It focuses on creating an interactive and easy-to-use interface for basic expense management.

### **3. Problem Statement**

Managing daily expenses manually can be difficult and time-consuming. Users may forget their previous expenses or find it difficult to calculate how much they have spent.

The Expense Tracker provides a digital solution that allows users to record expenses and view their total spending in an organized manner.

### **4. Objectives**

The main objectives of the project are:

- To create a simple expense management webpage.
- To allow users to add their daily expenses.
- To display expenses in an organized list.
- To calculate the total amount spent.
- To allow users to delete unwanted expense records.
- To provide a simple and user-friendly interface.
- To understand the practical implementation of HTML, CSS, and JavaScript.

### **5. Technologies Used**

#### **HTML**

HTML is used to create the basic structure of the webpage, including input fields, buttons, headings, and expense lists.

#### **CSS**

CSS is used to design the webpage and improve its appearance, layout, spacing, buttons, and overall user interface.

## **JavaScript**

JavaScript is used to add functionality and interactivity. It handles user input, adds expenses to the list, calculates the total amount, and removes expenses.

### **6. Main Features**

- Add new expenses.
- Enter expense amount and details.
- Categorize expenses.
- Display expense records.
- Calculate total expenses.
- Delete individual expenses.
- Simple and responsive user interface.

### **7. Working**

The user enters the required expense information and clicks the Add Expense button. JavaScript validates and processes the information and displays the expense on the webpage.

Whenever a new expense is added, the total amount is updated. Users can also remove an expense, after which the total is recalculated.

### **8. Expected Outcome**

The final application will provide users with a simple webpage through which they can record and monitor their daily expenses. The project will demonstrate the use of frontend technologies to create an interactive web application.

### **9. Future Scope**

The project can be improved in the future by adding:

- Local Storage for saving expenses.
- User login and registration.
- Database integration.
- Monthly and yearly expense reports.
- Charts and graphs.
- Budget management.
- Spending notifications.

- Mobile application support.

## **10. Conclusion**

Expense Tracker is a basic but useful frontend project that demonstrates how HTML, CSS, and JavaScript can be combined to develop an interactive web application. It provides a simple solution for recording and monitoring daily expenses while also providing practical experience in frontend development.
